

# Brewing in Pymont

Prepared for The Pymont  
History Group by  
Kevin Staunton-Lambert

[pymontbrewery.com.au](http://pymontbrewery.com.au)

## Brief history of Pymont beer swilling - **Pubs!**

Beer drinking in the pub has been central to working class Pymont in the truest sense of the word '**Public House**' since its earliest days - our national identity/culture - dinky di

Pymont pubs were **shared spaces** on literally every street corner amongst small terraces

*(there used to be 26 pubs in Pymont!)*

# Small Pymont private houses sharing a public house (pub)

Harlequin and Half Way House and  
Dunkirk/Quarrymans/Terminus/Point + Bridge, all very close

Half Way House  
Hotel

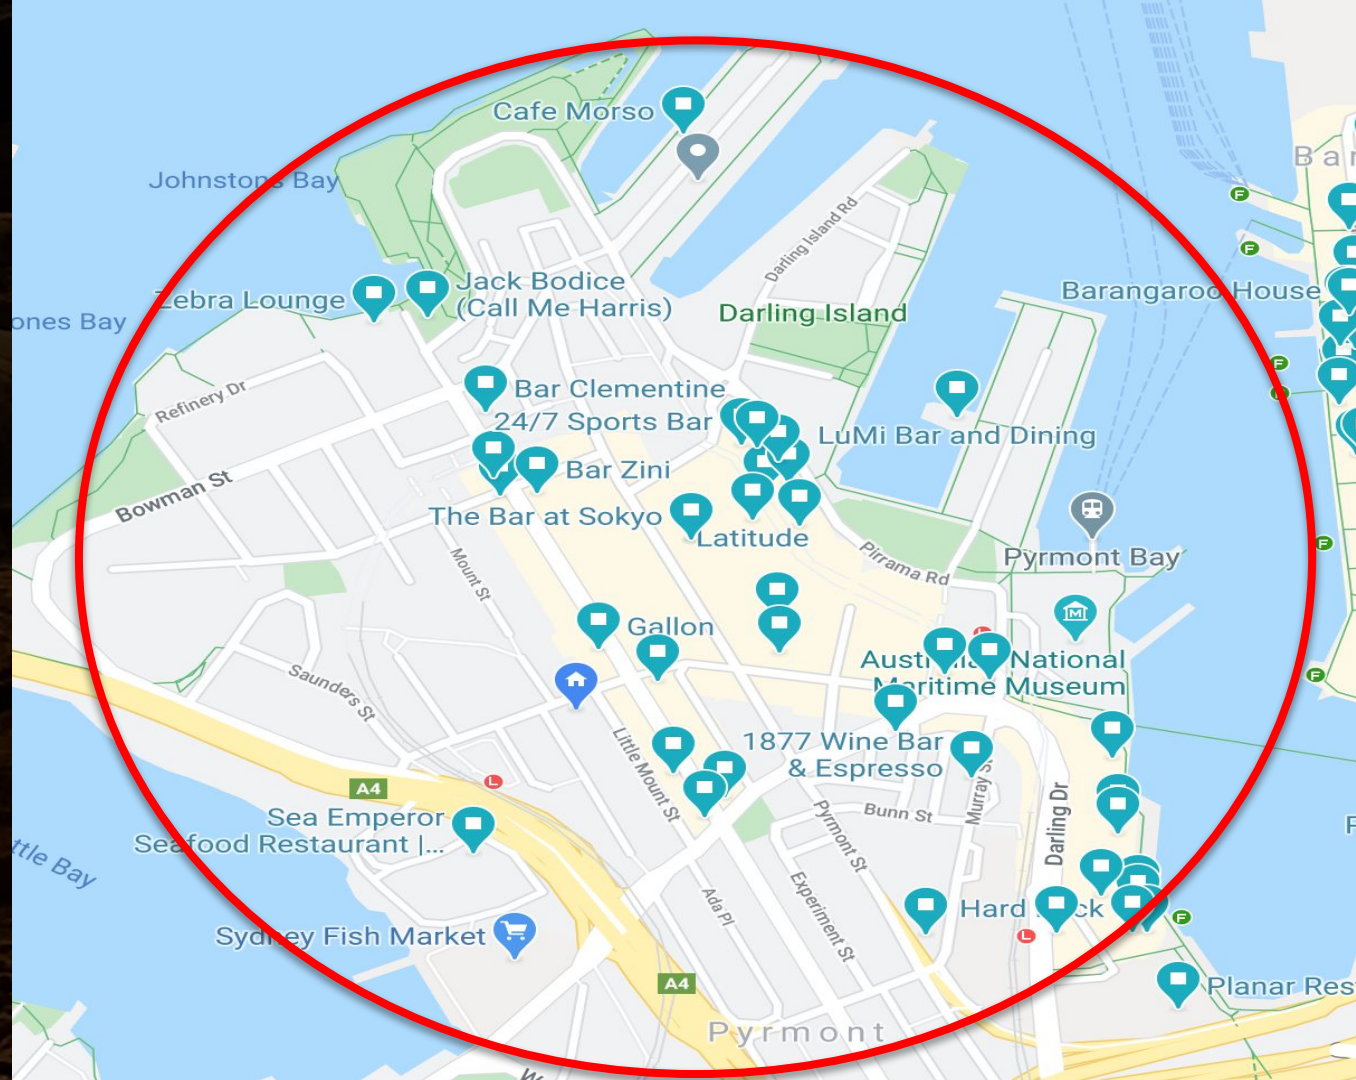

Harlequin  
(Duke of  
Edinburgh)

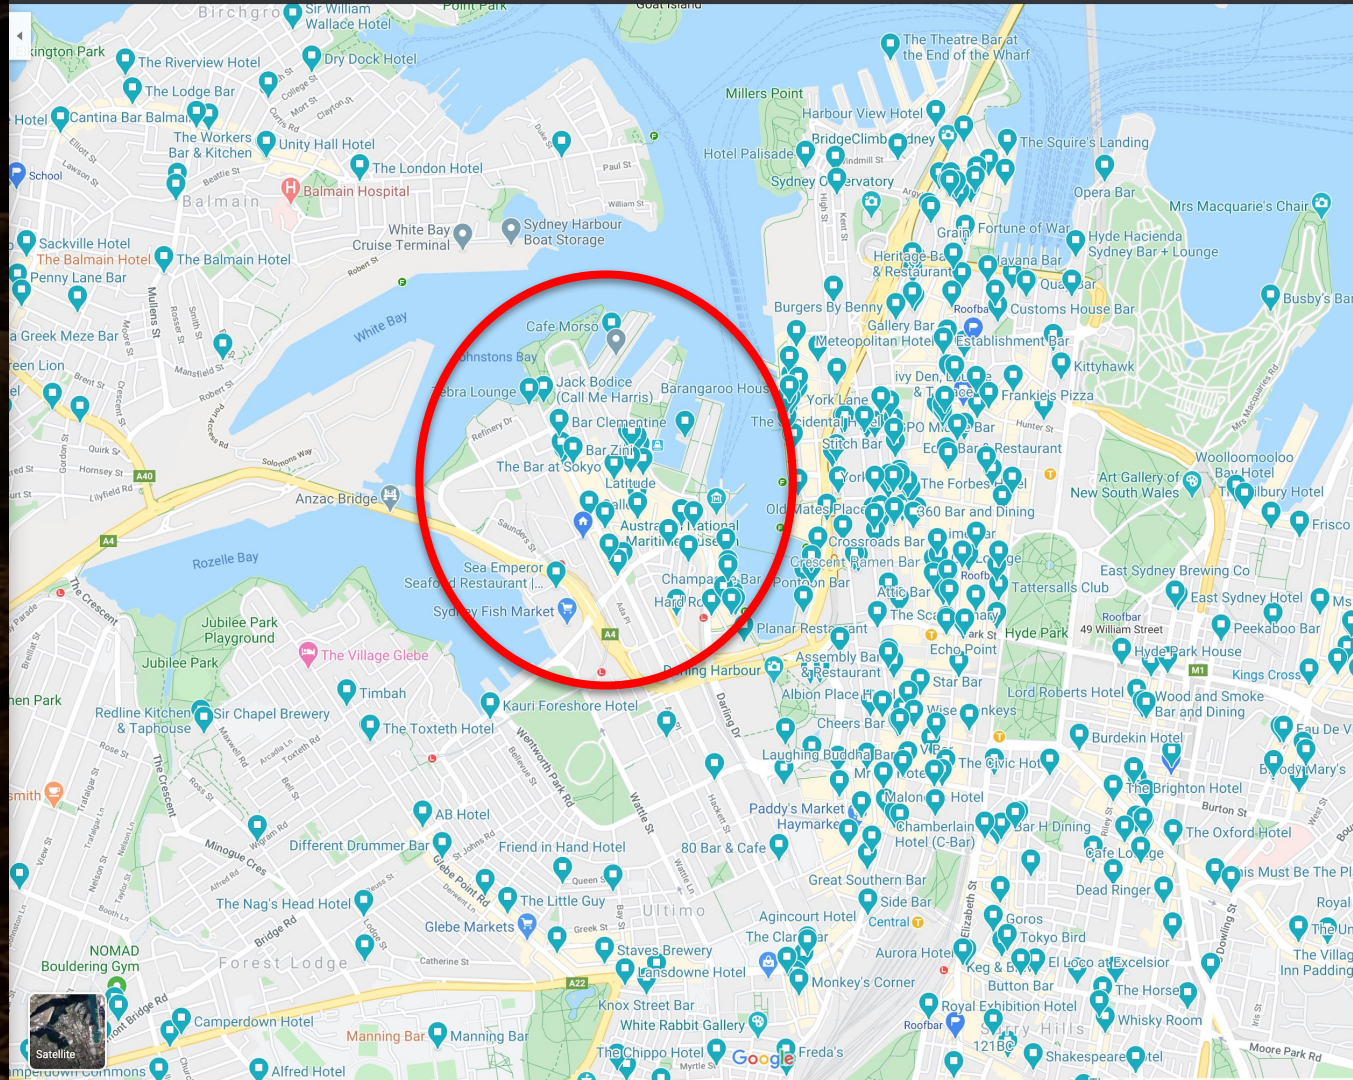

Pymont Brewery (pilot  
system) on Miller Street

Pymont  
Today still  
heaps  
of  
**local**  
pubs  
and  
bars in

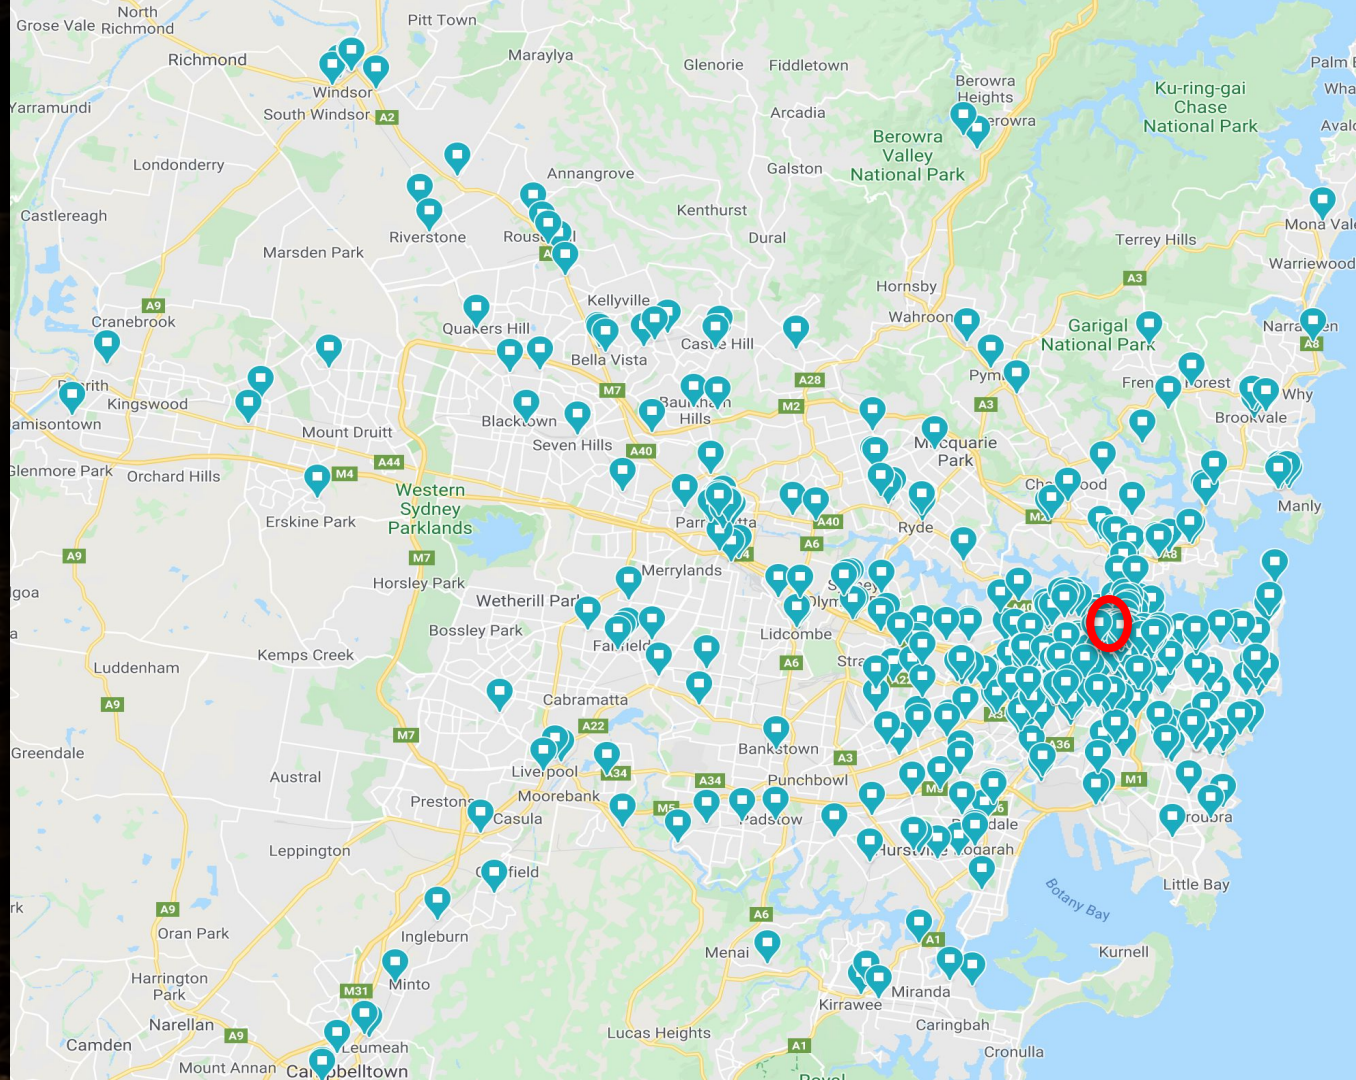

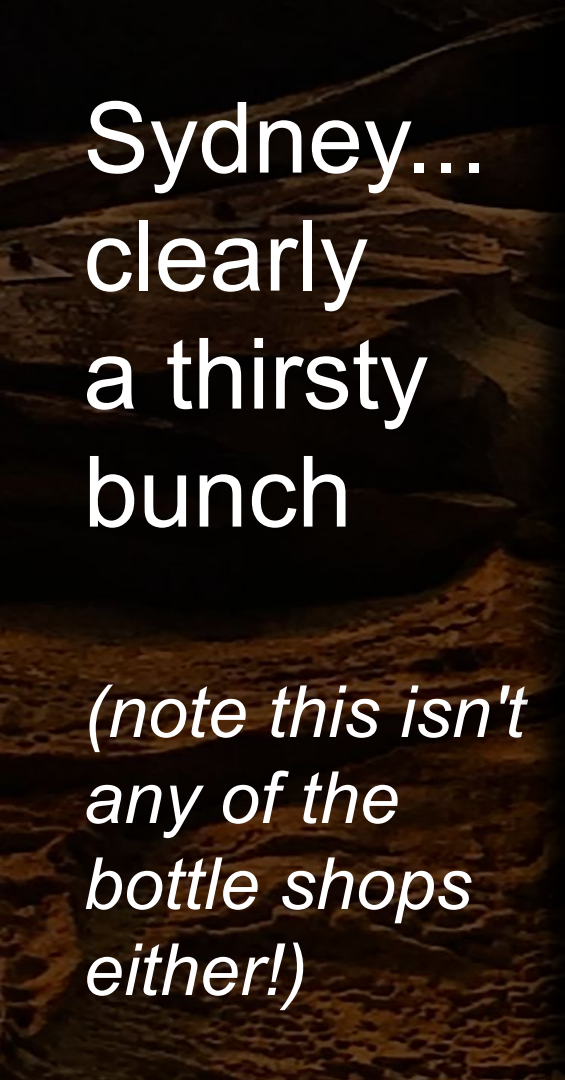

With  
plenty  
more  
near by...

Barangaroo  
City  
Glebe

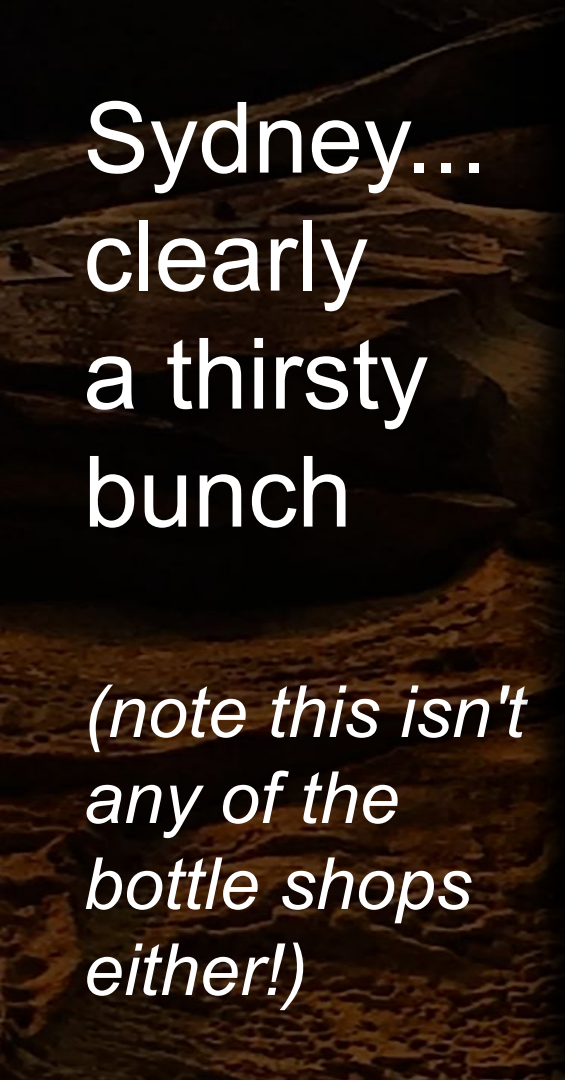

Zoom out  
Seriously  
heaps of  
pubs  
around!

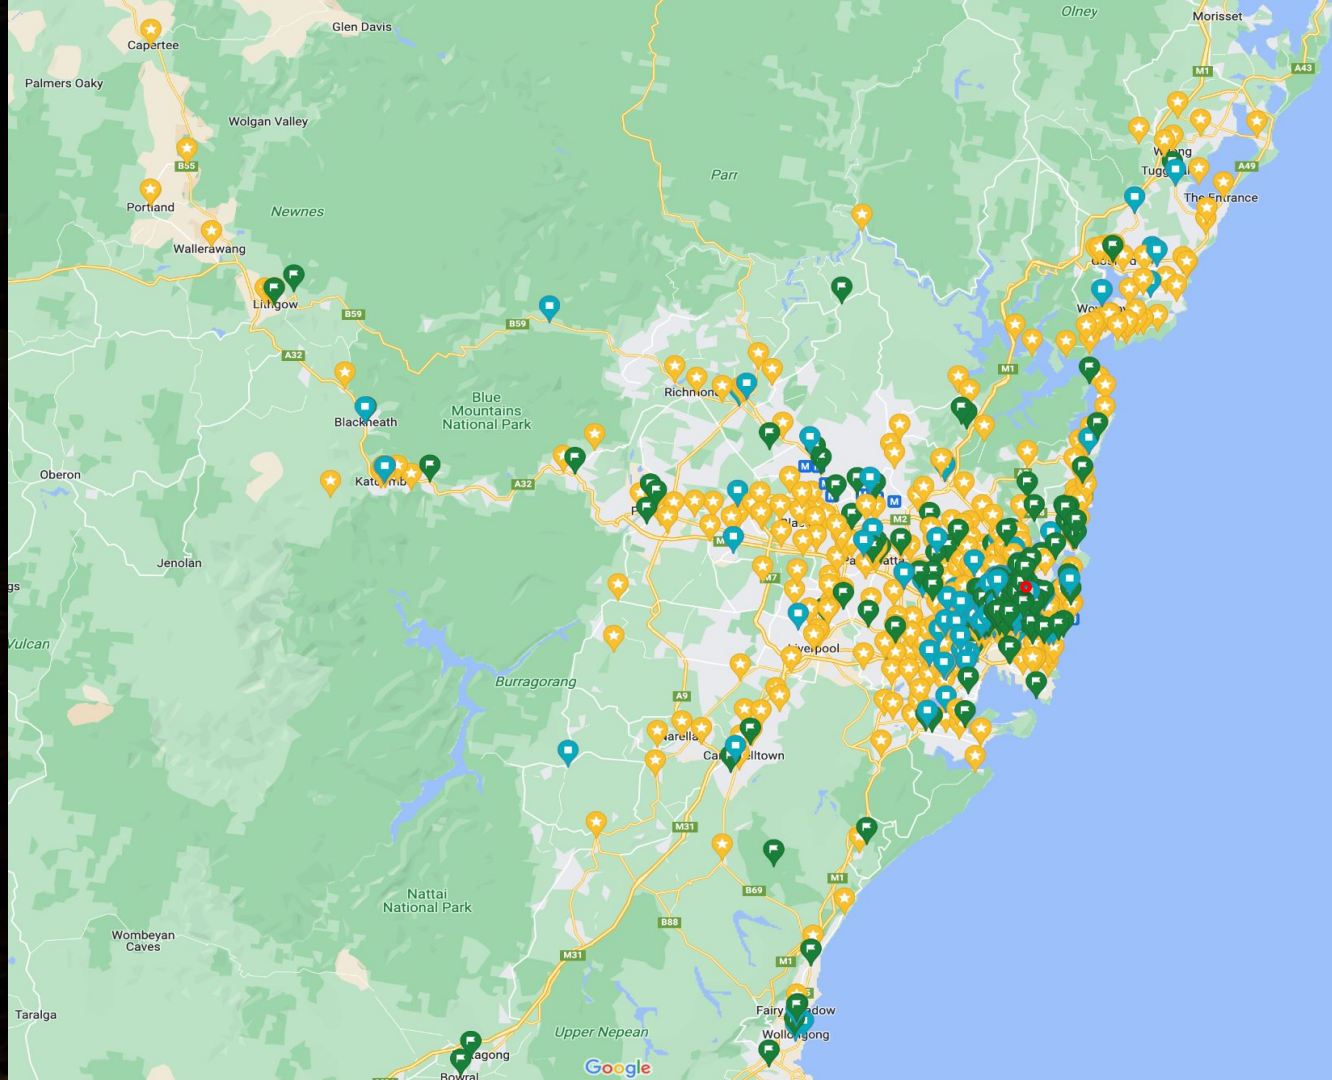

Sydney...  
clearly  
a thirsty  
bunch

*(note this isn't  
any of the  
bottle shops  
either!)*

Sydney...  
clearly  
a thirsty  
bunch

*(note this isn't  
any of the  
bottle shops  
either!)*

What may have been the first beer sold *in* Pymont?

James Squire was the first to brew ales\* near Meadowbank 1796 (8½ miles Pymont by boat)

Squire started with (bitter tasting) horehound but later was first to grow hops at Kissing Point Farm

\* John Boston may have beaten James to first commercial 'beer' sale, but that was corn based 'beer' bittered with a gruit of apple stalks and gooseberry leaves, quite different to using barley and hops beer! But defo applause for making do

Beer takes off! - Hobart's more **Beer** less **Rum!** 1802

*“The introduction of beer into general use among the inhabitants would certainly lessen the consumption of spirituous liquors [rum]. I have therefore in conformity with your suggestion taken measures for furnishing the colony with a supply of ten tons of Porter, **six bags of hops, and two complete sets of brewing materials.**”*

The HMS Porpoise brought those hops to Squire

Pymont Brewery in 1880 (Felmingham)

The Pymont History Group have on their [website](#) this [fabulous photo](#) of the earlier 1857-1902

Pymont Bridge clearly showing a 'Pymont Brewery' building >>

This was where the PBH is today  
(Murray and Union Streets)

# Pymont Brewery 1880 - 1887

William Jacka was brewer (formerly of Melrose Brewery)

## Owner/managers

1880 W. H. Felmingham

1881 J.G.H Swain and Co

1884 Edwards and Co

1885 Henry Edmeads

1886 Edward Wehlow

# Pymont Brewery in 1880's

Sydney Morning Herald write up was

*“the beer sent out being light,  
sound, and refreshingly bitter.*

*Every effort is made to assimilate  
this beer to the pale ale  
produced by Allsopp and Bass”*

## THE PYRMONT BREWERY.

A new brewery has recently been started in Union-street, Pymont, near the bridge, by Mr. Felmingham, and the owner has given it the name of the suburb in which it is situated. Brewing only commenced in June, but we are informed that the demand for the article produced at the Pymont Brewery is weekly increasing, the beer sent out being light, sound, and refreshingly bitter. Every effort is made to assimilate this beer to the pale ale produced by Allsopp and Bass, and a creditable amount of success has been attained. As colonial beers go that made at the Pymont Brewery is above the average, and it would be curious if it were not so, seeing that only malt, hops, sugar, and water are its ingredients, and that a brewer of large colonial experience superintends the manufacture. The machinery is good and well arranged, and the brewery, though at present small, is so arranged that it can be extended indefinitely. The foundation is of solid rock, so that the cellar, that important adjunct to an establishment of this kind, can be enlarged very easily when necessary.

# Pymont Brewery in 1880's (Sam) Allsopp and Bass Both 1700's English beer

Pymont Brewery  
is brewing English  
styles ales  
and some are here  
today!

Pymont Brewery in 1887

Sadly

Liquidated

Feb 1887

**THE PYRMONT BREWERY COMPANY (LIMITED.)**

AT an Extraordinary General Meeting of the members of the abovenamed Company duly convened and held at the Company's Office, Union-street, Pymont, on Monday, 24th January, 1887, the subjoined Resolutions were duly passed, and at a subsequent Extraordinary General Meeting of the members of the said Company also duly convened and held at the same place, on Tuesday, the 8th February, 1887, the said Resolutions were duly confirmed:—

**RESOLUTIONS.**

1. That the Pymont Brewery Company (Limited), be wound up, in pursuance of the Company's Act 37 Victoria No. 19, and that James A. Patterson, James M. Johnson, and A. S. D. Harston shall be the Liquidators.

2. That the decision of signature of the said Liquidators shall

Also, eh oh... *Beer Excise Tariff act 1901*

Introducing beer helped quash the rum rebellion,  
but this new act of parliament made other  
breweries like Pymont Brewery unsustainable

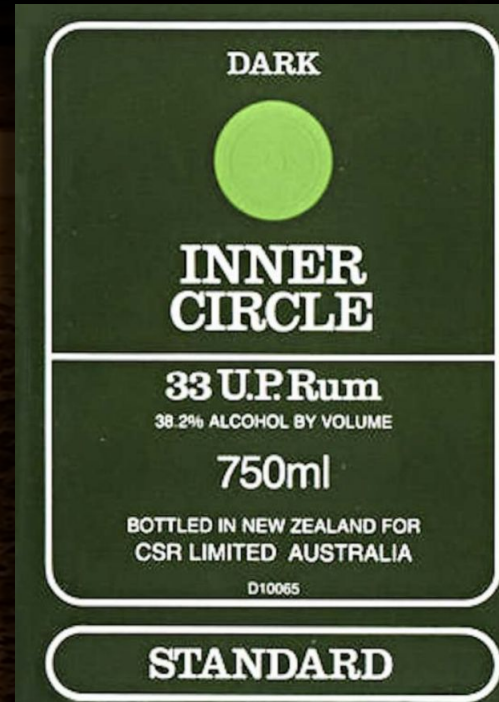

**17 local Sydney breweries - including two local  
Ultimo breweries were lost forever! 😞**

[Transformations: Ecology of Pymont peninsula 1788 - 2008 cites Tooth and  
Co Brewery Sydney for this insight]

Other alcohol production *in* Pymont (since 1900)

The Colonial Sugar Refining Company  
(Jackson's Landing) distilled ind. spirit  
methylated alcohol, also small batch  
pot still 'Inner Circle' rum made from  
molasses coming from Fiji and  
Queensland

'Inner Circle' was highest quality rum

Other alcohol production *in* Pymont (since 1900)

CSR rums evolved to become  
Bundaberg

33.U.P and O.P refers to proof of  
volatility, compared with energy of  
gunpowder ~ 33% over/under that  
today you know as Bundaberg UP/OP

What about the traditional custodians of Pirrama?

There is evidence that Aboriginal people were well aware of fermentation processes to make beverages

But the Eucalyptus described in the process only grows cooler places. e.g. Tasmanian 'Cider trees' - it seems then less likely that alcohol was actually made in the local Pirrama / Gadigal territory before European settlement

# Modern beer brewing today in Gadigal territory

Obviously the **Lord Nelson** (Rocks) needs a honorary mention, on-site brewing since 1986!

+ fair number of newer breweries in order of distance from Pyrmont...

**All Hands** (Darling Harbour), **Staves** (Broadway),

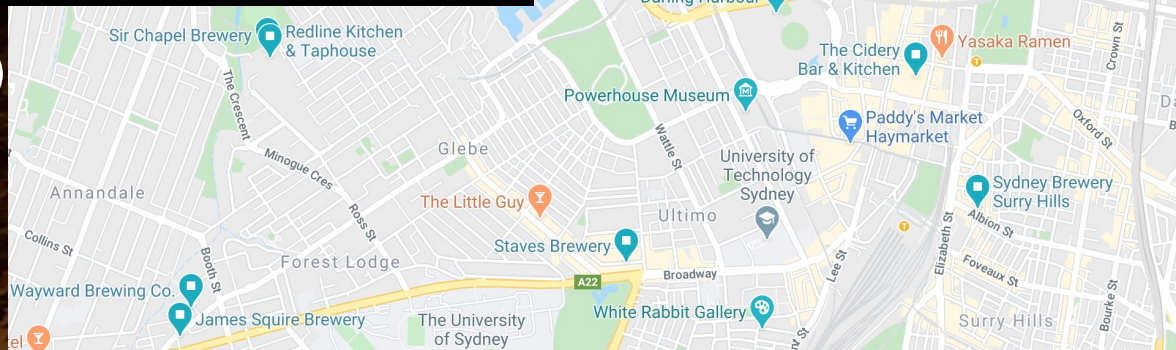

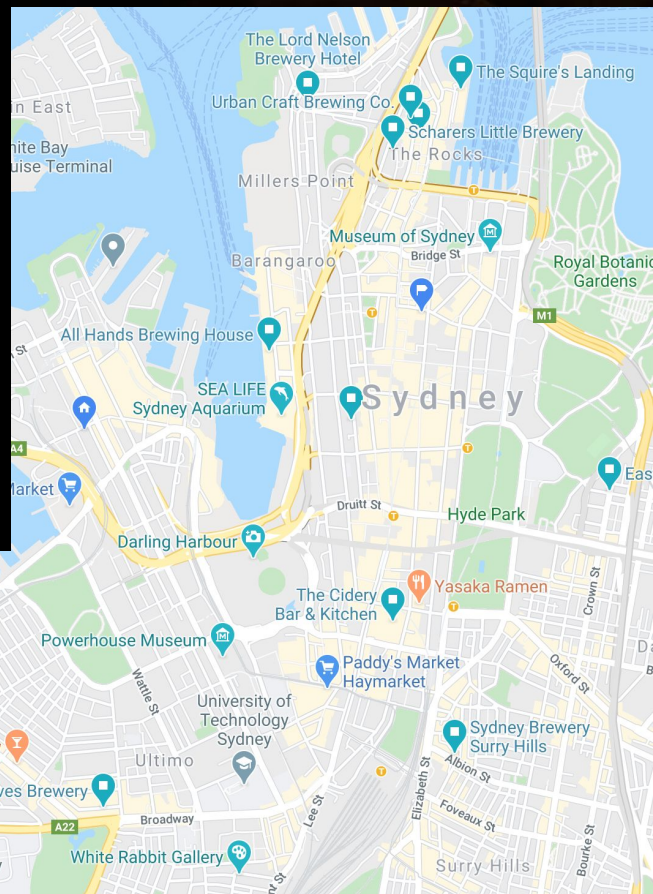

**Redline** (Tramsheds),

**Wayward** and

**Malt Shovel** (Camperdown)

**The Surry Hills** and

**Redoak**

Quick recap of what beer actually is...

Barley seed is planted in a field (make grain)

Harvested grain is malted (release starches)

Malt is mashed to make wort (release sugars)

Wort (sweet syrup) is boiled with hops (make bitter)

This is fermented with yeast (yeast loves sugar)

Yeast by product is ethanol (alcohol) + CO<sub>2</sub> gas

# Challenges of brewing in 1790s vs how it is today

- #1 Finding fresh Grain (growing and malting barley)
- #2 Milling and Mashing (converting starches to sugar)
- #3 Lautering (removing spent grain/sparge to get wort)
- #4 Boiling wort with hops (kill enzymes, hops flavour)
- #5 Fermenting with yeast (= ethanol alcohol + CO<sub>2</sub>)
- #6 Conditioning, packaging and distributing

Modern beer, just the same but a little more tech!

# Challenge #1 - Getting quality fresh Grain (malt)

Easy today but you do still need quite a lot!

A typical 50L (1/2 bbl)

Commercial keg ~ 12-15kg  
(around half a sack min)

Consider that amount in  
colonial days farming effort!

# #1 - Grain providers in 1800s Australia

Many barley growers, including Squire (45 acres)

**William Farrer** was  
first to cross-breed  
barley in Australia  
Making it hardy to  
diseases like 'rust'

## #1 - Colonial grain malt - Varieties

Not a great deal of choice in colonial barley growing, most likely seeds would have come from England, Pioneer (the brewery in Orange of that name actually grows their own today!)

Mittagong was the first barley Maltings (1899)

Malts are germinated barley grains (sprouting) which have been dried in a kiln, often roasted

#1- 'Base Malts' produced in Australia today  
Spartacus/LaTrobe/Bass/etc **barley** grown and  
malted/kilned within Australia - 900kt of malt  
from one million tonnes of barley prod per year!

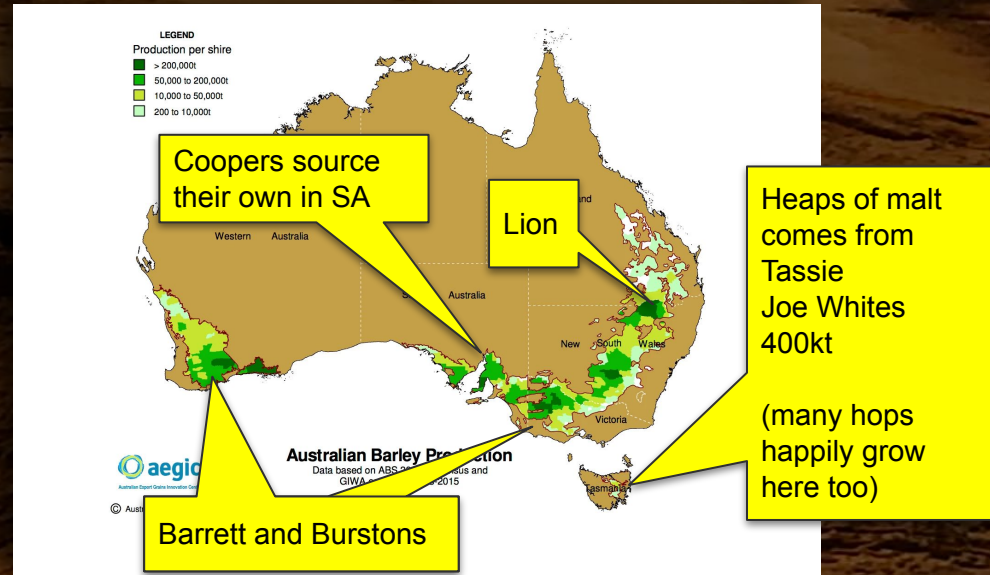

Pale (2 row) malt

Pilsner malt

Ale malt

Vienna malt

Munich malt

# #1 - 'Specialty malt' grown or imported in Oz

Same barley, but longer/hotter roasts for flavour

Low diastatic

Chocolate

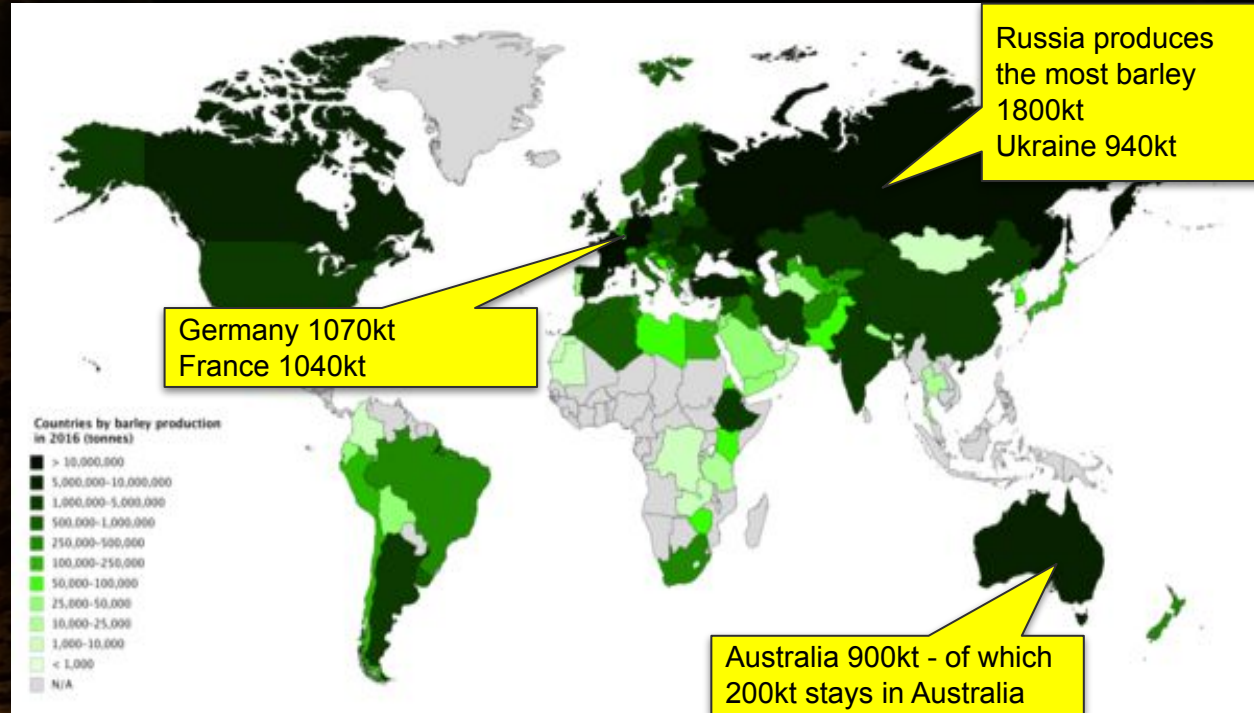

Carahel/pils/\*

Aciduated

Crystal

Patent Black

*... many more ...*

# #1 - Grain choices, why we mix grains together

Base malts typically give the best sugars, so Ales, Pale Ales, Pilsners base style - but beer pretty much would just taste pretty much like any other if we only using those grains

Roasted barley malts for raisins and toffees and chocolate flavours and colours

Smoked malts, can give peaty notes, or full on Rauchbier

Adjuncts, like sorghum for gluten free beer and lower carbs

Some grains literally for colour or increase acid (helps enzymes)

And some grains simply give you good head! e.g. in most hazy beers typically lots of oats needs a balance of cara for any retention

## #2 - Mill/Crush the grain bill into hot water (liquor)

Mashing is wetting then holding crushed grain at various temperatures for enzymes to convert starches into sugars - different grains and beer styles vary in their mash steps

Ale malts typically **67°C** for 1 hour

Many variations = flavours...

Getting it wrong affects efficiency = cost

## #2 - Mashing (enzymes convert starches sugars)

Pilsner malt **51°C** for 30min *then* **67°C** for 30min!

Many grains also need a 'mash out' at 75C to avoid diacetyl (= bad esters) being released

In 1790's Sydney, how did they?  
brews were likely pretty inefficient

(this by the way is how it's done today - this is computer controlled heating with a sensitive thermocouple feedback to electrical element - very precise step mash = best efficient)

### #3 - Lauter / Sparging the grain out of the wort

Removing the grain to leave only wort (*said wert*)

Large tanks used in larger breweries actually sift the grain husks away, on small scale you just make a tea bag

Then gently (very very gently) wash the grain through, at **75°C** to about **115%** liquor

#4 - Boiling - easy enough in colonial days too

Literally hard boil at **100°C** (no less) for an hour to 1½ hours (any volume - hence that extra **15%** liquor)

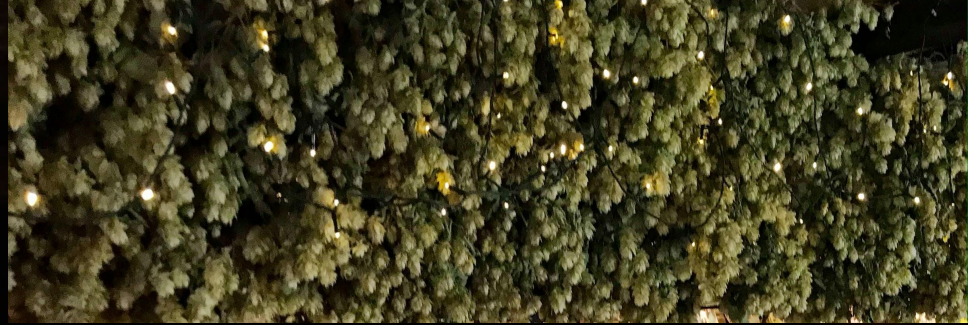

Hops added in various stages

Bittering hops in at the start  
+ often in the middle boil

Aromatic hops go in at the end

## #4 - Hop choices (then)

Hops once frowned upon, balance beer without  
can be sickly sweet Bittering hops from Kent  
oast houses first arrived on HMS Daedalus

James Squire grew on **4 acres** at Kissing Point

Likely was Goldings hop > 200 years cultivation

Unlikely to have (any) aromatic varieties around

# #4 - Hop choices (today)

Varieties of hop, many are Aussie and NZ ones!

## Bittering Hops

Admiral, Agnus, Apollom, Banner, Bitter Gold, Bravo, Brewer's Gold, Bullion, California, **Cluster**, Chelan, Comet, **Dr Rudi**, Eastern Gold, Eroica, Feux-Coeur, Galena, **Galaxy**, **Green Bullet**, Kitamidori, Magnum, Millennium, Newport, Outeniqua, **Pacific Gem**, **Pacific Sunrise**, Pilot, **Pride of Ringwood**, **Rakau**, **Riwaka**, Satus, **Sticklebract**, Sorachi Ace, **Southern Brewer**, **Southern Star**, Sovereign, Summit, **Super Alpha**, **Super Pride**, **Styr Golding**, Symphony, Tillicum, Toyomidori, **Vic Secret**, Warrior, Yakima Cluster, Zenith, Zeus

## Aromatic Hops

Ahil, Ahtanum, Amarillo, Amethyst, Aquila, Aramis, **Astra**, Atlas, Backa, Bianca, Blato, Blisk, Boadicea, BOR, Bramling, Canadian Redvine, Canterbury Whitebine, **Cascade** Cekin, Celeia, Cobb, Columbia, Crystal, Dana, Defender, Density, Dunav, Early Bird, Early Green, Early Prolific, Early Promise, East Kent Golding, Eastern Green, Eastwell Golding, **Enigma**, El Dorado, **Ella**, Elsaesser, Equinox, **Feux-Coeur Francais**, First Choice, Fuggle, Furano Ace, Gargoyle, Golden Star, Golding, Groene Bel, **Hallertau**, **Hallertau**, Helga, Hersbrucker, Red-Stem, Hüll Melon, **Hort4337**, **Hort9909**, Hybrid-2, Ivanhoe, Janus, Jester, Keyworth's Early + Midseason, **Kohatu**, Landhopfen, Liberty, Lubelska, Lubelska-Pulawy, Lucan, **Melba**, Mandarina Bavaria, Mathon, **Motueka**, Mount Hood, Mount Rainier, Nadwislanska, **Nelson Sauvignon** Nordgaard, Olympic, Omega, **Pacific Jade**, **Pacifica**, Palisade, Petham Golding, Pocket Talisman, Precoce de Bourgogne, Premiant, Progress, Record, Red Earth, Riwaka, Saaz, Santiam, Saphir, Saxon, Serebrianka, Shinshuwase, Sladek, Sonnet, Spalt, Spalter, **Summer**, **Sylva**, **Topaz**, **Wai-iti**, **Waimea**, **Willametta** ...  
(lots and lots of hop varieties basically)

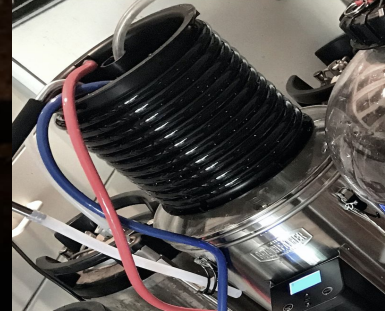

## #5 - Cool and Oxygenate the boiled wort

Yeast is very fickle about temperature!

Fermenting in Sydney would be tricky in depths of winter and heights of summer (but easy today)

Saison/Kveik yeast happy at 28C fast (5 days) - Ale yeasts at 18-22C is ok (takes 10 days) - Lager flat out dies outside of 8-12C needs precision diacetyl resting (takes 3 months)

This is all modern yeasts - again, how did James Squire and John Boston manage in the 1790's?!

# #5 - Cool and Oxygenate the boiled wort

Cooling and aeration in  
1795

“Yorkshire Square” was  
invented in Huddersfield  
(near Rat and Ratchet very near  
where I lived as a student!)

Barm forms on surface...

## #5 - Yeast

Sugar  $\rightarrow$  Ethanol + CO<sub>2</sub>

Colonial yeast  
would have all been wild

Barmy top feeding yeast made from  
flour/water, then left outside a week

“Ale Stick” acts as a starter that yeast propagates  
from, this is the secret sauce of many a brewery

## #5 - Wild yeast (Coolship)

Mountain Culture (Katoomba)  
wild yeast only beer as a  
colab with the Wildflower  
fermentery

How it was and to still do it

*They* have fresh UNESCO Blue  
Mountain air - *Pymont* has notes  
of ANZAC bridge + Hymix cement

NOT a hot tub you want to  
get in to :-)

# #5 - Fermentation

Sugars to Ethanol and CO<sub>2</sub>

Time and temperature  
depends on the yeast

top or bottom feeding (ale vs lager)

amount of active cells (little mouths to feed)

amount of initial sugars (food the yeast has)

Some yeasts need to be revived with nutrients

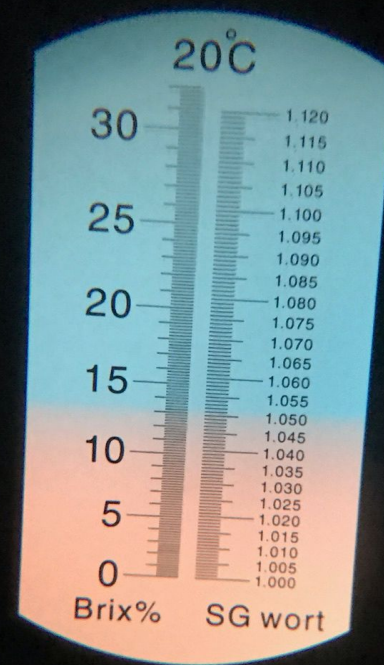

## #5 - Fermentation (how boozy)

How we know the % volume of ethanol in beer?

Original Gravity shown in the refractometer here is 1.050,  
Final (after fermentation) 1.008

$(OG - FG) * 131.25 = 5.5\%$  alcohol by volume

Light bends in a sugar solution, difference at end of fermentation tells us **exactly** the % alcohol that was made

## #5 - Dry hopping in ferment

Many modern hoppy beers,  
esp IPA often have additional hops  
added during fermentation

Cold hops go in  
either as pellets, or liquid hop  
shots (tea made with hops)

Important not to let oxygen in - e.g  
sanitized hop container dropped  
by magnets is one I use

## #6 - Racking and Conditioning (depends on style)

Beers often take weeks to condition and become 'brite' ready to drink

Medieval ale, drank 'fresh' still fermenting

Oktoberfest Märzens traditionally made way back in April!

## #6 - Zero and low alcohol beer? Heat to 78.3C

Alcohol has a *lower* boiling temperature than the beer

Holding the beer at 79C boils off (almost) all the alcohol with only marginal losses in volume but CO<sub>2</sub> needs to be reintroduced

So this is why you find low/zeros are pretty pricey still  
Typically cost a bit more to make, but no excise tax  
Same method here can work for making near zero versions of your favourite wine, gin etc

## #6 - Packaging up beer

**Then:** cask barrels and glass bottles

**Today:** craft beer is mostly kegs, cans and growlers

Cans are typically favoured today - they cut out light strike, have a better oxygen barrier, and are easy to label

## #6 - Pymont Brewery Distribution (then)

Via horse dray cart to  
pretty much anyone that  
wants a beer

Pymont has various stables as it turns out  
for all the hard working quarry horses  
Including Gallon Pub and above the pub at  
the top of the its quarry face you'll find the  
another

## #6 - Pymont Brewery Distribution (today)

Much red tape and bureaucracy

Unfortunately very few pubs  
actually own or have any control  
over their beer taps at all  
Package sales are poor in pubs  
It's all pretty anti-competitive  
frankly outside of the bottleo

But there **are** free samples  
around! Tap room in planning

## #6 - Pymont Brewery (what's next for Pymont)

Pymont Brewery beers are local distribution only to private businesses and events right now...

but this *is changing* with a larger 1,300,000 litre / year operation **with a taproom** in planning for around end of 2030

Naturally investors welcome

See <https://tinyurl.com/BeerAI>

# How Pymont Brewery makes consistent beer

Basically we measure and note down everything!

By improving our end-to-end beer production using modern machine learning and artificial intelligence techniques we can optimise inventory, monitor every trend in our hot and cold side production, lab results, keg/canning metrics and link through end product feedback looking to good and bad patterns

# How we ensures it's a consistent beer product

▶ **WHAT** beers were considered good by our end customers and any trusted sensory circles (brewers and purveyors)

**WHY** was it good? Trace back to anything that went wrong what went right, what was easier/cheaper with identical measured quality, ABV, colour, flavour and aroma profiles

**HOW** to consistently repeat any good batch again and again and do this across geographically distributed production sites

# We're also in the Metaverse VR/AR

Well it got your attention right?... whist defo part gimmick - the tech is **not**!

Pymont Brewery can build an online presence for Apple Vision Pro and Meta Quest headset users at home or captive environments like aircraft, cruises etc

Product familiarity online, your beer in virtual venues with ties to ways to obtain the real deal. Targeted product placements, you know you user like a dark beer? Then dark it is, got a promo to share? wherever they go in the Metaverse worlds

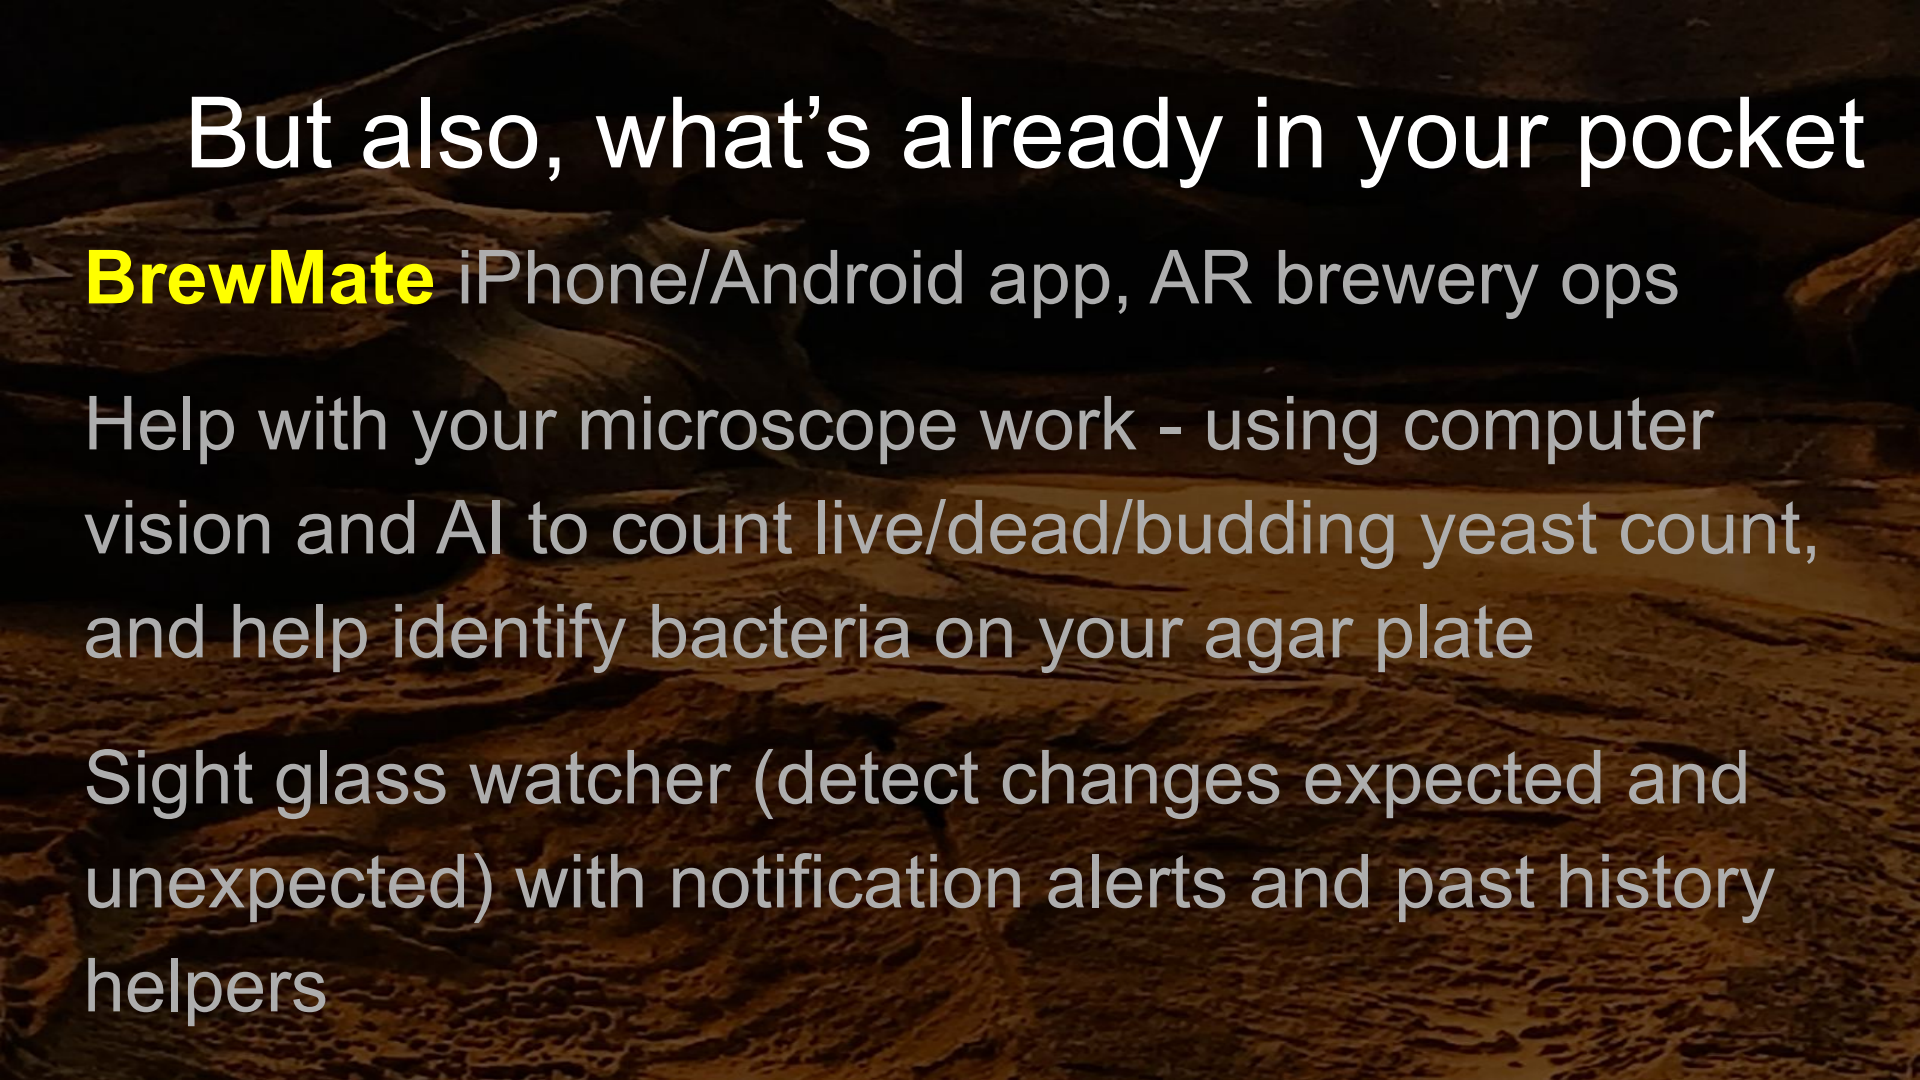

Real public feedback! Real but virtual meet the brewer fireside chats

Sales, ingredients partner, bottle shop rep AMA events tied back to your product

Beer geek meetups recipe sharing and suggestions what you might brew next

Using mixed reality to help you brew!

# But also, what's already in your pocket

➤ **BrewMate** iPhone/Android app, AR brewery ops

Help with your microscope work - using computer vision and AI to count live/dead/budding yeast count, and help identify bacteria on your agar plate

Sight glass watcher (detect changes expected and unexpected) with notification alerts and past history helpers

# Virtual and Augmented reality beer - **brewing**

AR glasses visualise what's in this tank, what's the next step?

Vessels can be assigned virtual timers and milestones, continually monitor pH, gravity, temperature, change colour if they are CIP, under large head pressure what level with what

A head brewer, product line manager can also work at home or office on multiple brew sites and visit them virtually, maybe in different states/countries

Brew days can be wound back and replayed DVR style

# Virtual and Augmented reality brewery - **sales**

Build and scale real beer in a VR Horizon World - let patrons help design the next recipe, or competition per week for the next brew - they get to keep the NFT to the unscaled recipe

Brand other VR worlds bottles/beer mats with your labels - take your merch to other worlds wear your own apparel

Sell you beer in the Metaverse for Alecoin

May small royalties on your recipe or merchandise NFTs if they are later on sold at profit or loss

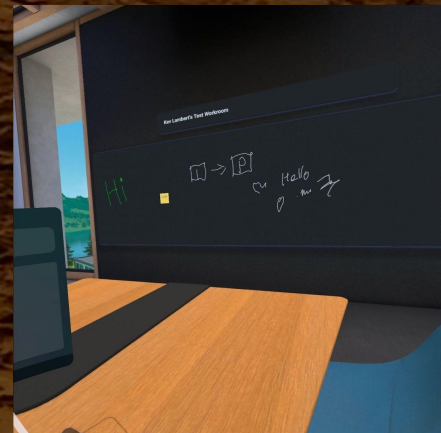

# Colab brewing, sharing a virtual brew sheet

Live designing a beer recipe or party-gyle mash up ideas with others in a remote city or country!

Existing we'll known algorithms can show predicted cost but also gravity, alcohol by volume, hop bitterness and colour of the beer with real time adjustments

API interactions with Google Sheets etc means

Sharing is easy and SSO secured to individuals

# Augmented reality brewery planning!

See your brewhouse layout in your sites, try same vessels in multiple sites, which works best, what looks most appealing for a tap room customer vs forklift access and sustainability

Plan better for drainage, power, shorten your glycol runs

In this space how many fermenter vessel and bright will fit

What if they are stacked?

What will it look like in VR or even AR at the real premises

James' brews couldn't have been like modern beer

Guessing what Squires beer *did* taste is most likely a warm(ish) flat English ale (Marris Otter like flavours from Pioneer pedigree grain with low alpha hop)

None the less the quality was reportedly "**most excellent**", and when James Squire died in 1822 he had the largest turn out at his Sydney funeral!

So what *did* the old Sydney beer taste like?

Obviously some guessing based on what we know to grow local

Simple ale grains, wild yeast, low oil bittering hops (no aromatics), low control over temperature during mash and ferment, likely oxidation throughout, low carbonation and lightly to not chilled at all

So what *does* old Sydney beer taste like?

Pymont Brewery Dark Mild is a very basic ale using old school simple pale ale grain and little to no modern techniques  
*(outside of cleanliness requirements)*

It will have some similar characteristics for sure

Program:
